Version 2.0:

- Updated for Phoenix 1.0.7.3+
- Updated Admin page to bootstrap design matching actual admin page
- Updated header module to abstract executable module
- Updated coding to match actual Phoenix standards

How it Works:

Responsive and Localized Store Logos will add a new Logo page to your admin where you can upload 3 different logo sizes for each of your store languages.

A new alternative header content module is included which will display the Logo just like the standard core logo module.

Purposes:

1. Serve different logo sizes to allow the visitors browser to select the most appropriate for it's device size and resolution. The browser will automatically download only the logo which fits best it's need.

Example: You are using a banner style store logo which is set to half of the header width (col-6)

- for a standard desktop screen and a retina tablet a width of about 640px would be good
- for a retina desktop device with double resolution like i-mac, 1280px would be better
- for a small simple mobile phone 320px would be optimum to save download time.

This add-on allows you to upload 3 different sizes of your store logo (1280px, 640px and 320px for this example)

If your store logo uses the full width (col-12), upload for example the sizes 2560px, 1280px and 640px.

2. If you wish to use different versions of the Store Logo for each of your store languages, you can now easily upload a different set of logos for each language.

It is not mandatory, You can use one and the same logo and only upload to the default language. It will be used then for all languages.

If you wish to automatically serve different image sizes for all your store images:

KissIt Image Thumbnailer Pro for OsC 2.3.4.1 CE Frozen and all Phoenix versions available:
